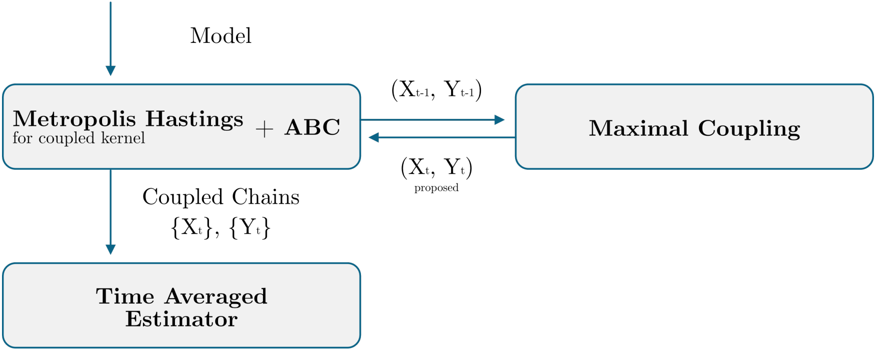
Approximate Bayesian Computation

The complete method: MCMC + Couplings + ABC

Implementation



Maximal coupling

Maximal coupling between two distributions p and q

- sample $X \sim p$;
- sample $W|X \sim \mathcal{U}\{[0, p(X)]\}$;
- if $W \leq q(X)$ then output (X, X), otherwise:
  1. sample $Y \sim q$;
  2. sample $W^\star|Y \sim \mathcal{U}\{[0, q(Y)]\}$ until $W^\star > p(Y)$
  3. output (X, Y).

Output

Distribution of a pair of random variables X, Y that maximizes $\mathbb{P}(X = Y)$ subject to the marginal constraints $X \sim p$ and $Y \sim q$

Metropolis Hastings with couplings and ABC

Model

$$Y_i|\mu, \sigma^2 \overset{iid}{\sim} \mathcal{N}(\mu, \sigma^2)$$

$$\mu \sim \mathcal{N}(\mu_0, \sigma_0^2)$$

$$\sigma^2 \sim InvGa(a, b)$$

$$\mu_0 = 8, \quad \sigma_0^2 = 4$$

$$a = b = 1$$

Metropolis Hastings with couplings and ABC

Initilization

set $\boldsymbol{\theta} = (\mu, \sigma^2)$
for k=1,2:
until $K_h(||s_k^{(0)} - s_{obs}||) > 0$:

- sample $\boldsymbol{\theta}_k^{(0)} \sim \pi(\boldsymbol{\theta})$
- simulate n_{obs} observations $y_{ki} \sim \mathcal{N}(\mu^{(0)}, \sigma^{2(0)})$ from maximal coupling
- compute $s_k^{(0)} = S(y_k)$;

Metropolis Hastings with couplings and ABC

Iterations

for i = 1,...,M:
given $\boldsymbol{\theta}^{(i-1)} = (\mu^{(i-1)}, \sigma^{2(i-1)})$

- generate $[\boldsymbol{\theta}_1^{(i)}, \boldsymbol{\theta}_2^{(i)}]$ from a maximalcoupling given $[\boldsymbol{\theta}_1^{(i-1)}, \boldsymbol{\theta}_2^{(i-1)}]$;
- for k=1,2:
  1. simulate n_{obs} observations $y_k^{(i)} \sim \mathcal{N}(\mu^{(i)}, \sigma^{2(i)})$ from maximal coupling;
  2. compute $s_k^{(i)} = S(y_k)$;
  3. accept $\boldsymbol{\theta}_k^{(i)}$ with probability

$$\frac{K_h(||s_k^{(i)} - s_{obs}||)\pi(\boldsymbol{\theta}_k^{(i)})}{K_h(||s_k^{(i-1)} - s_{obs}||)\pi(\boldsymbol{\theta}_k^{(i-1)})}$$

Metropolis Hastings with couplings and ABC

Output

for k= 1,2

$$\mu_k^{(1)}, \ldots, \mu_k^{(M)} \sim \pi_{ABC}(\mu | y_{obs});$$

$$\sigma_k^{2(1)}, \ldots, \sigma_k^{2(M)} \sim \pi_{ABC}(\sigma | y_{obs}).$$

Study case

Summary statistics: Sample mean, Sample Variance
Distance: $L^2 - norm$
Kernel: $K(u) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}u^2}, \quad K_h(u) = \frac{K(\frac{u}{h})}{h}$
Proposal distribution: $\begin{bmatrix} \mu' \\ log(\sigma^{2\prime}) \end{bmatrix} \sim \mathcal{N}\left(\begin{bmatrix} \mu^{(i)} \\ log(\sigma^{2(i)}) \end{bmatrix}, 0.1^2 \cdot \mathcal{I}\right)$

Study case

Summary statistics: Sample mean, Sample Variance
Distance: $L^2 - norm$
Kernel: $K(u) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}u^2}, \quad K_h(u) = \frac{K(\frac{u}{h})}{h}$
Proposal distribution: $\begin{bmatrix} \mu' \\ log(\sigma^{2\prime}) \end{bmatrix} \sim \mathcal{N}\left(\begin{bmatrix} \mu^{(i)} \\ log(\sigma^{2(i)}) \end{bmatrix}, 0.1^2 \cdot \mathcal{I}\right)$

Dataset

100 samples generated from a Gaussian distribution:

$$Y_{obs} \sim \mathcal{N}(\mu_{obs}, \sigma^2_{obs})$$

$$\mu_{obs} = 10, \sigma^2_{obs} = 3$$

Numerical experiment: g-and-k distribution

Model

Quantile function

$$r \in (0,1) \longmapsto a + b(1 + 0.8\left(\frac{1 - exp(-g \cdot z(r))}{1 + exp(-g \cdot z(r))}\right)(1 + z(r)^2)^k \cdot z(r)$$

where $z(r)$ is the r-th quantile of the standard Normal distribution.

Prior distributions

$$a \sim \mathcal{U}([0,10])$$

$$b \sim \mathcal{U}([0,10])$$

$$g \sim \mathcal{U}([0,10])$$

$$k \sim \mathcal{U}([0,10])$$

Study case

Summary statistics: 10 quantiles
Distance: $L^2 - norm$
Kernel:

$$K(u) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}u^2}, \quad K_h(u) = \frac{K(\frac{u}{h})}{h}$$

Dataset

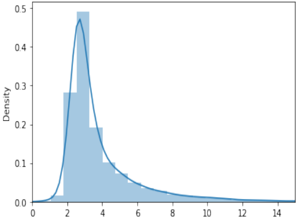
100 samples generated as follows:

$$a_{obs} = 3, b_{obs} = 1, g_{obs} = 2, k_{obs} = 0.5$$

$$y_{obs} \sim quantilefunction(z(r), \theta_{obs})$$

$$z(r) \sim \mathcal{N}(0, 1)$$

Quantile distribution: y_{obs}



Metropolis Hastings with couplings and ABC

Initialization

given $\theta = (a, b, g, k)$
for k=1,2:
Untill $K_h(\|s_k^{(0)} - s_{obs}\|) > 0$:

- Generate $\theta_k^{(0)} \sim \mathcal{U}([0, 10]^4)$ from prior density.
- Generate $z(r) \sim \mathcal{N}(0, 1)$
- Generate a sample of n_{obs} observations such that $y_k \sim quantilefunction(z(r), \theta_k^0)$
- Compute $s_k^{(0)} = S(y_k)$

Iterations

for i in (1,...,M):

- generate $\theta_1^{(i)}, \theta_2^{(i)}$ from maximalcoupling$(\theta_1^{(i-1)}, \theta_2^{(i-1)})$
- simulate n_{obs} observations $y_1^{(i)}$,$y_2^{(i)}$ from maximal coupling
- Compute the summaries $s_k^{(i)} = S(y_k^{(i)})$
- Accept $\theta_k^{(i)}$ with probability

$$\frac{Kh(\|s_k^{(i)} - s_{obs}\|)\pi(\theta_k^{(i)})}{Kh(\|s_k^{(i-1)} - s_{obs}\|)\pi(\theta_k^{(i-1)})}$$

otherwise $\theta_k^{(i)} = \theta_k^{(i-1)}$;

Metropolis Hastings with couplings and ABC

Iterations

for i in (1, ..., M)

Couplings

for j in (1,...,n_{obs}):

1. $z^{(i,j)}(r) \sim \mathcal{N}(0,1)$
2. generate:

$$y_1^{(ij)} \sim quantilefunction(z^{(i,j)}(r), \theta_1^{(i-1)})$$

$$y_2^{(ij)} \sim quantilefunction(z^{(i,j)}(r), \theta_2^{(i-1)})$$

$Kh(\|s_k^{(i)} - s_{obs}\|)\pi(\theta_k^{(i)})$

otherwise $\theta_k^{(i)} = \theta_k^{(i-1)}$;
